How do we know that we know?

Some observations from metacognition

Asher Koriat

University of Haifa

The crossover model of subjective experience

**Conscious
Information**

Explicit Mode

**Controlled
Behavior**

**Unconscious
Activation**

Implicit Mode

**Automatic
Behavior**

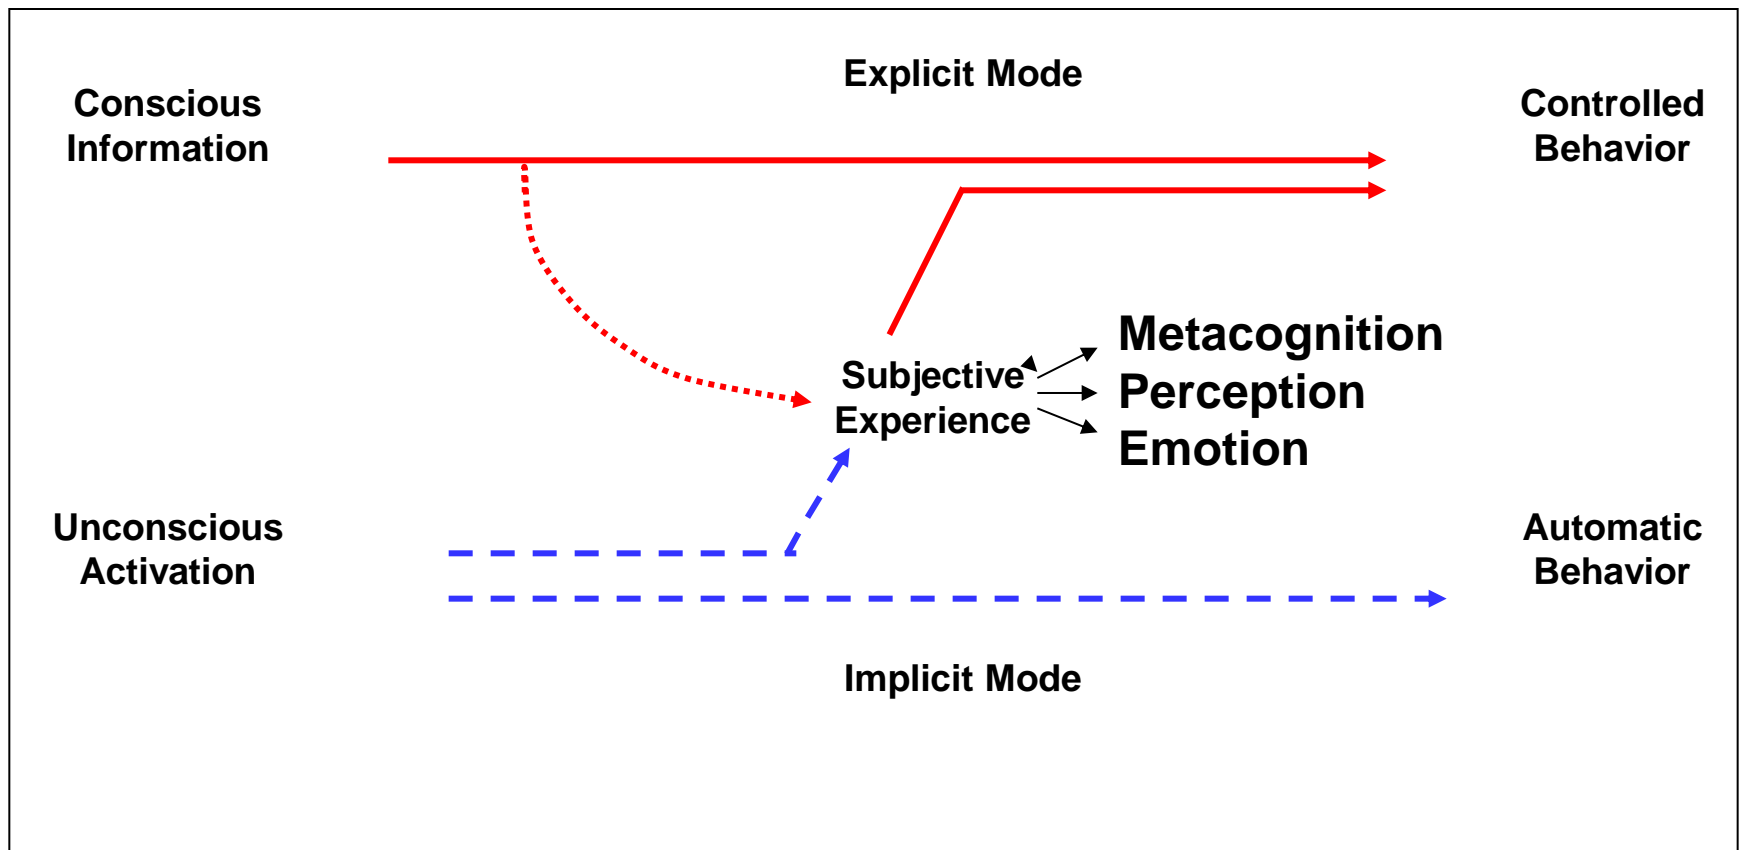

Figure 2. The Crossover model of subjective experience and conscious/unconscious influences on behavior (Koriat, 2000).

The crossover model of subjective experience

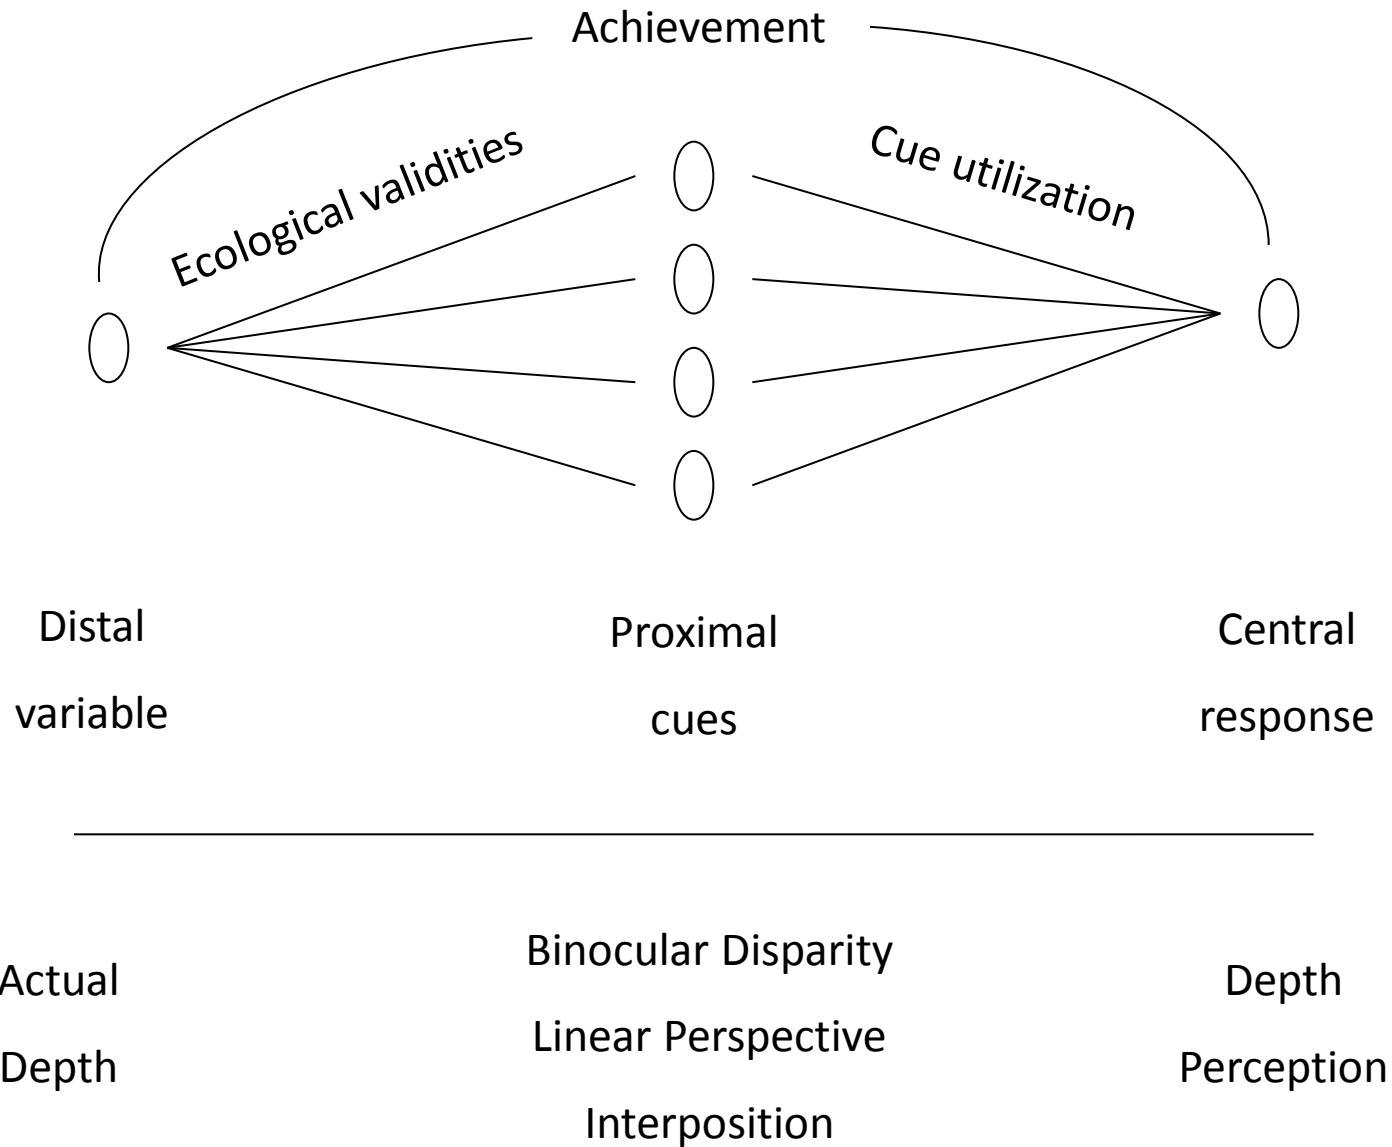

The Bases of Metacognitive judgments

Three types of theories:

- (1) Trace Access**
- (2) Information/theory based**
- (3) Experience based**

Brunswik's lens model

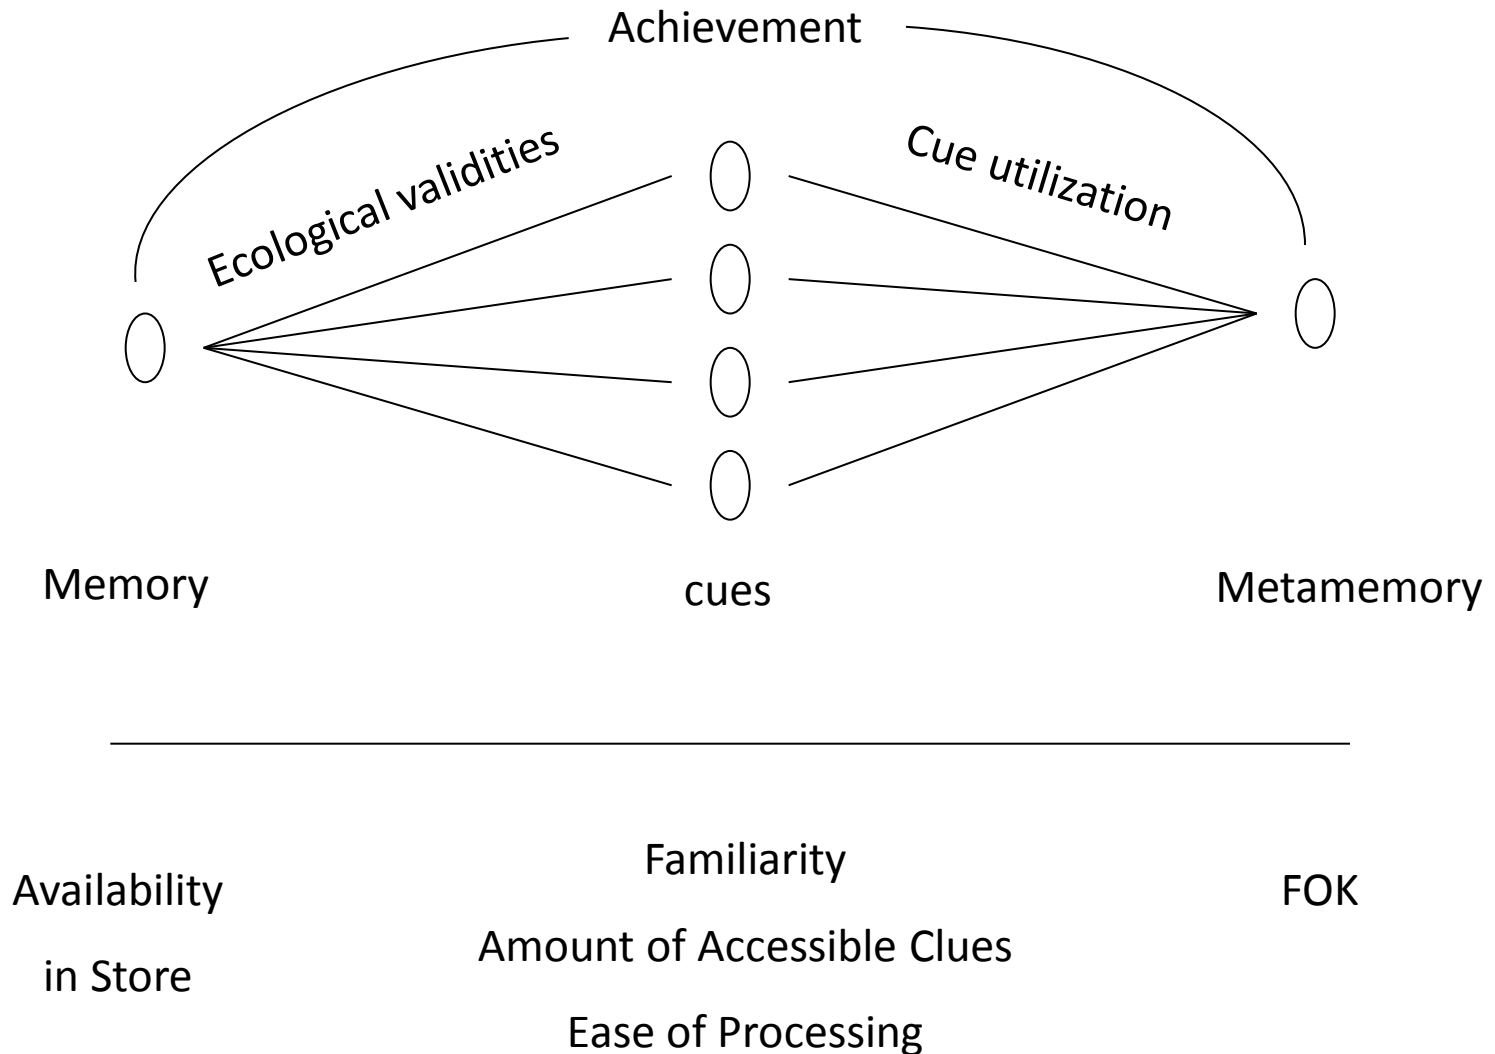

own
memory

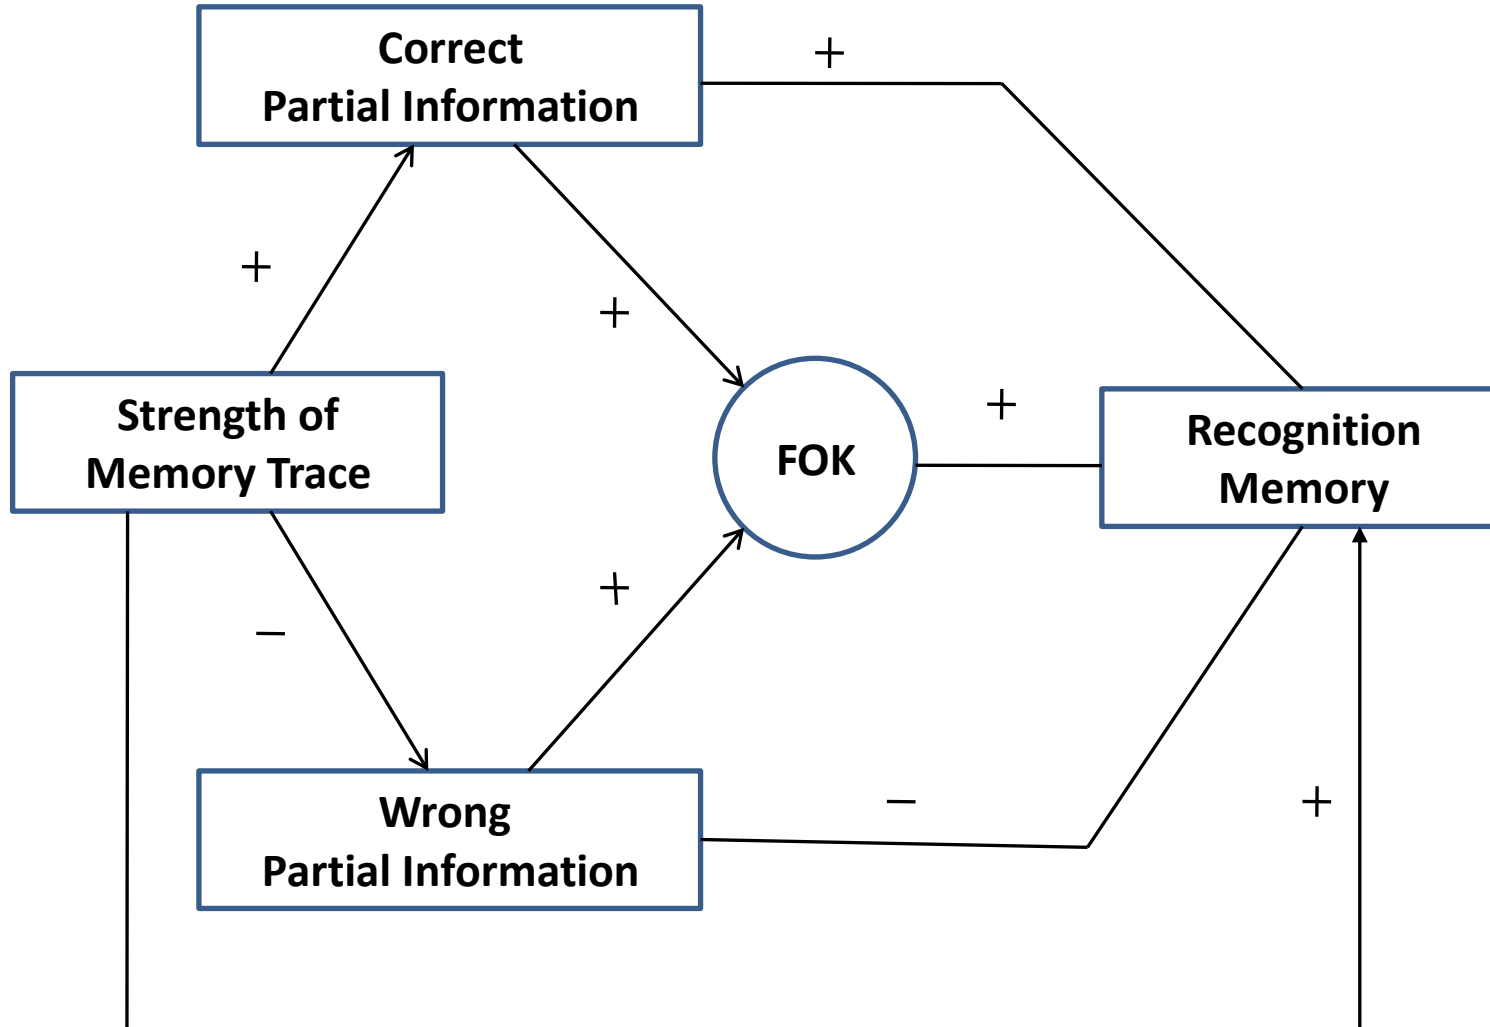

Outside
world

Brunswik's lens model applied to subjective monitoring

The feeling of knowing

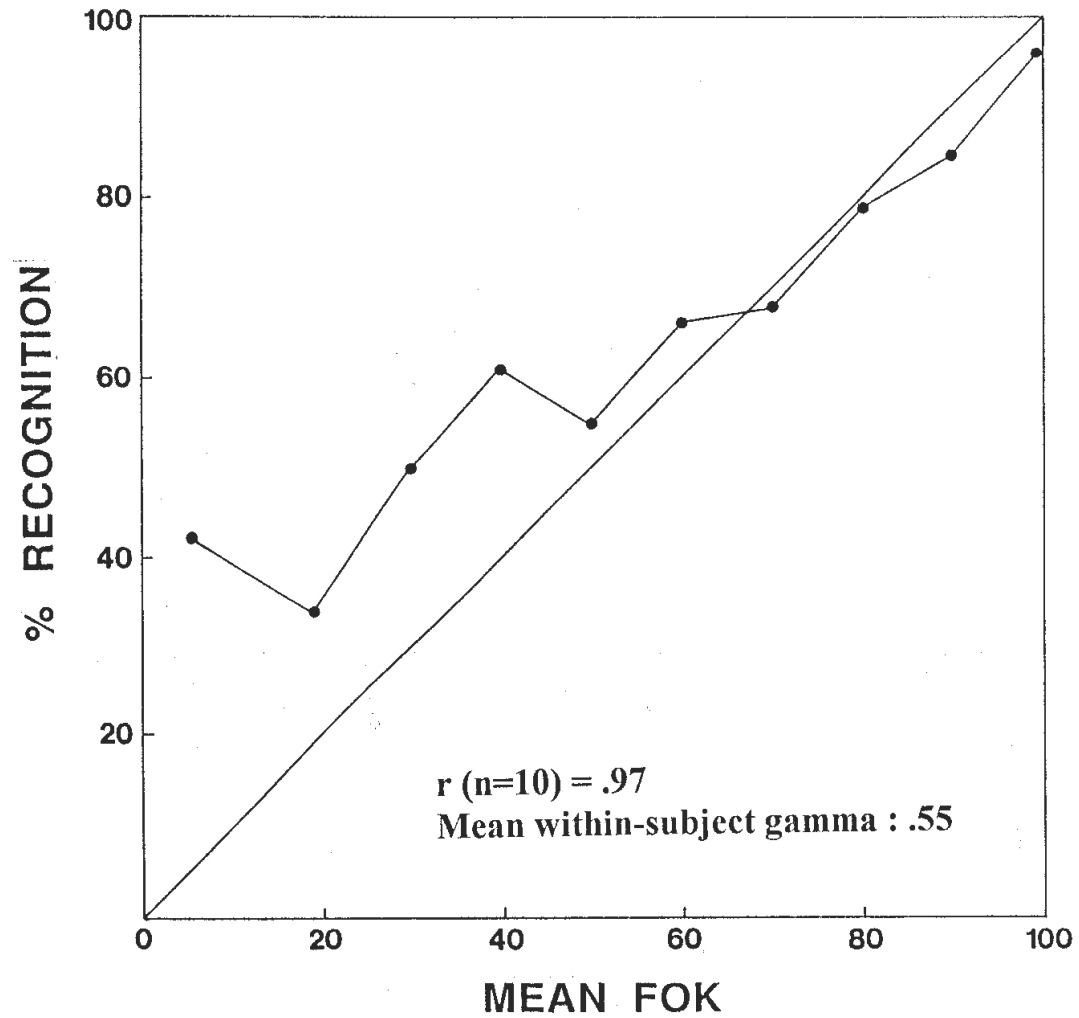

The feeling of knowing

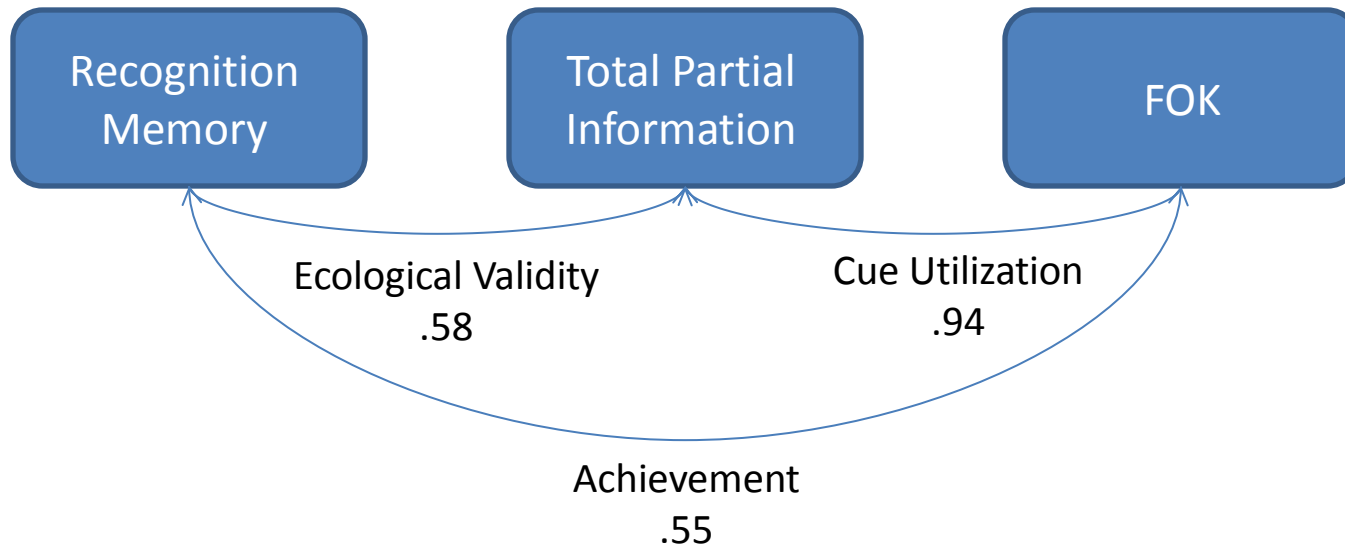

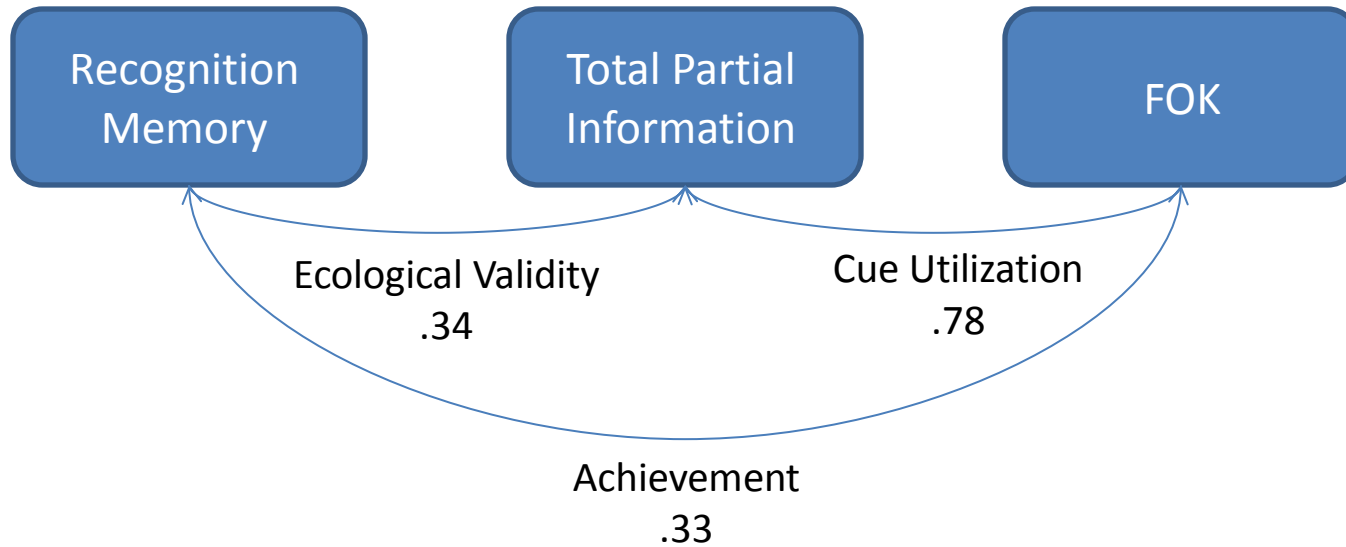

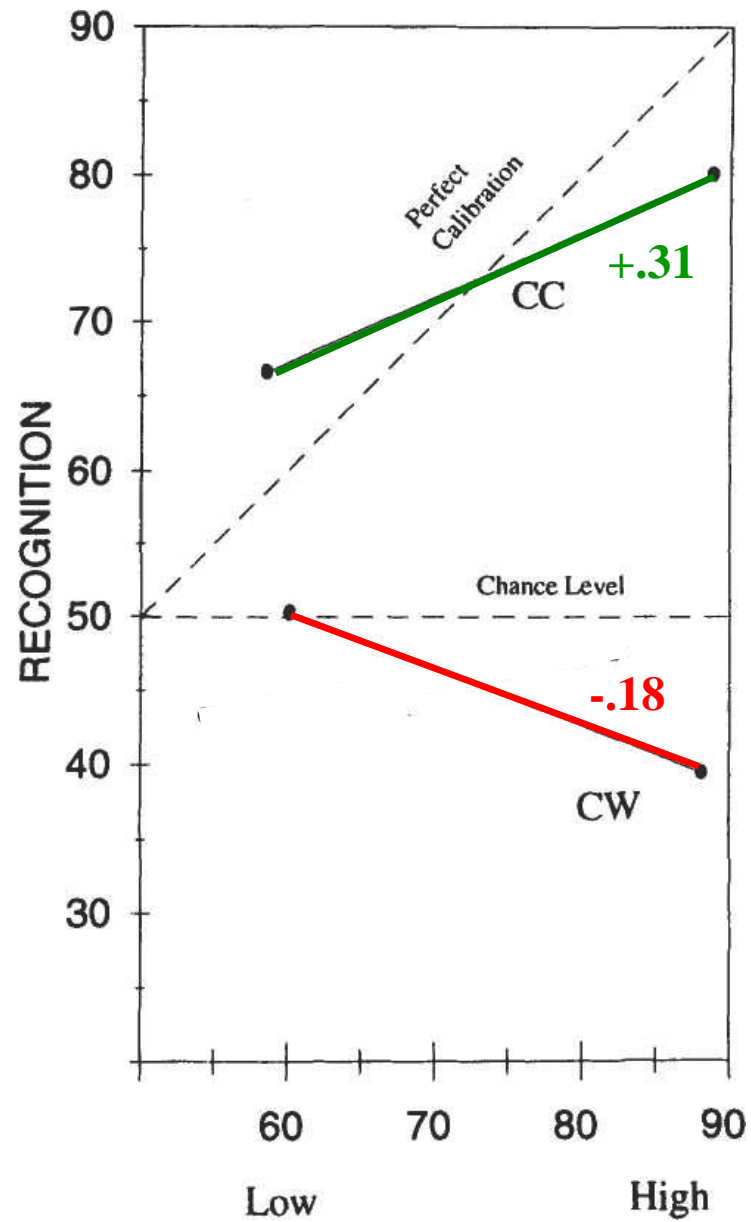

Koriat, 1993; Exp. 1

Cue : Accessibility (Number of Letter Retrieved)

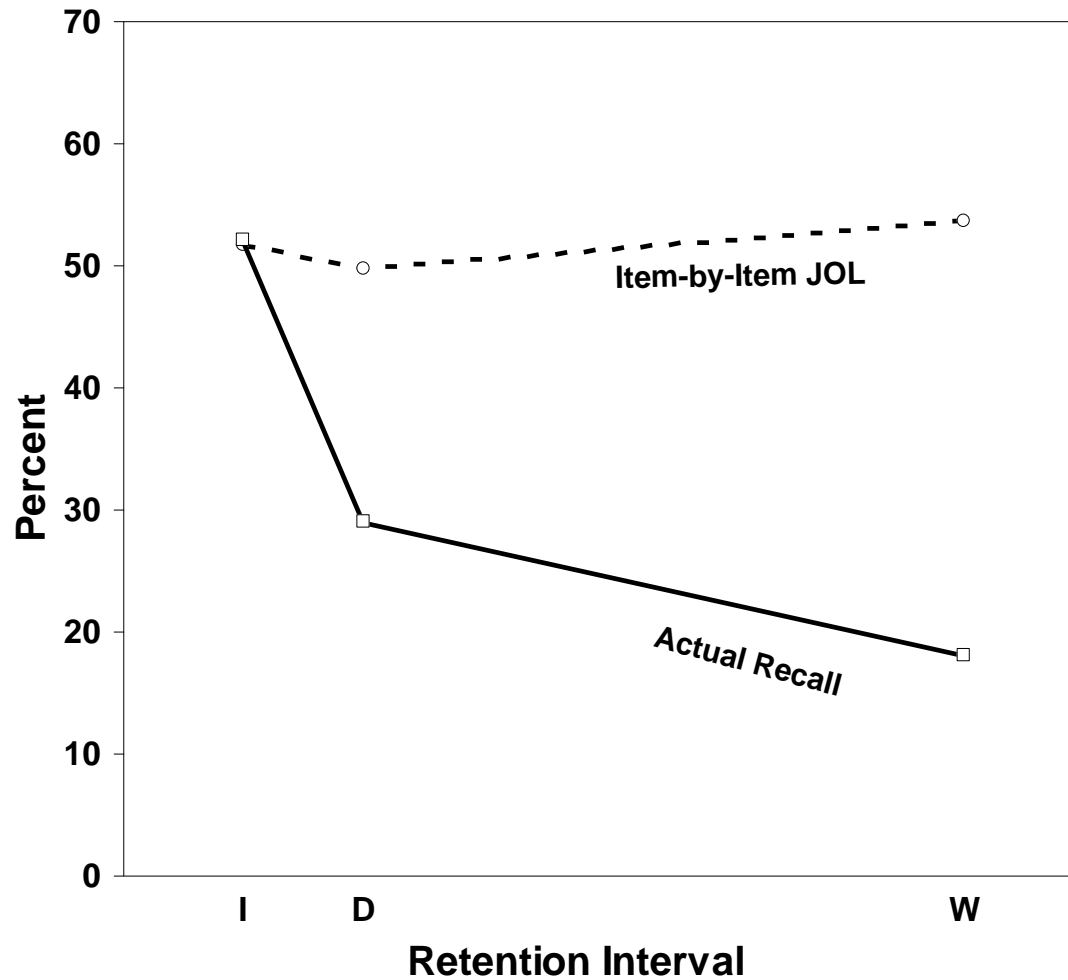

Koriat, 1995

Judgments of learning

The Effects of Retention Interval

Forgetting Framing

How many words will people forget?

	10 minutes	One Week	One Year
Estimate	52.6%	66.7%	81.3%
	n = 28	n = 26	n = 26

\underline{F} (2,77) = 17.56, \underline{p} < .0001

Monitoring Accuracy

The control function of judgments of learning

JOL —▶ Study Time —▶ **JOL**

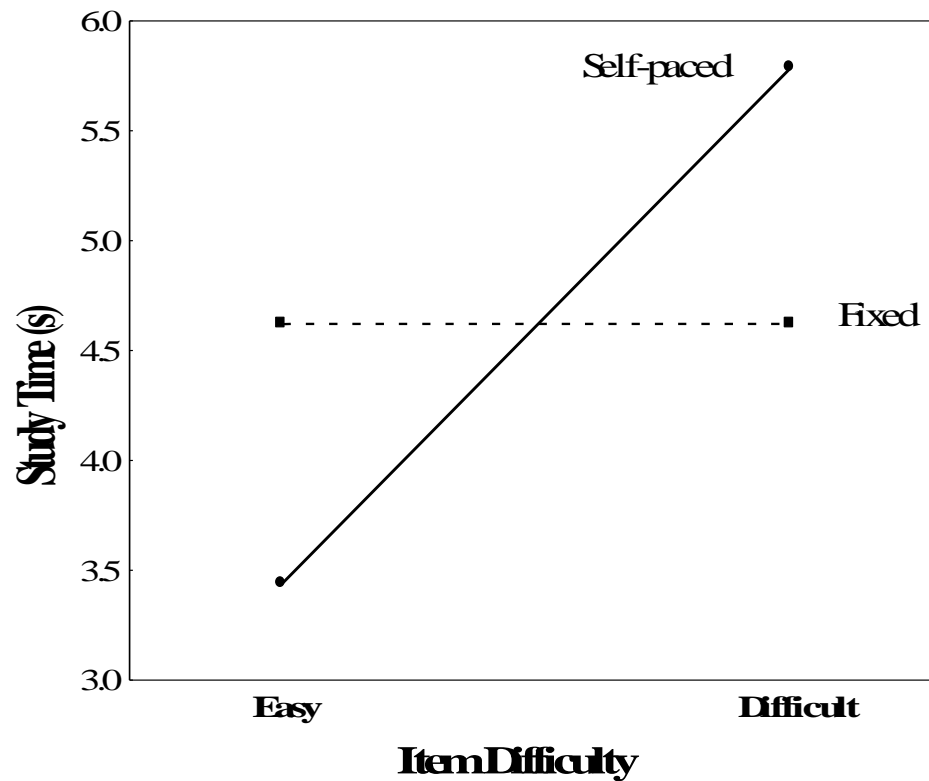

Study time is used in the service of self-regulation

Fear —▶ Running Away —▶ **Fear**

The effects of study time on recall and JOL

Self-Paced: Control over study time

Fixed: Equal study time for all items

Expected Effects on Recall

Monitoring —▶ **Control**

Control —▶ **Monitoring**

Subjective Experience —▶ **Behavior**

Behavior —▶ **Subjective Experience**

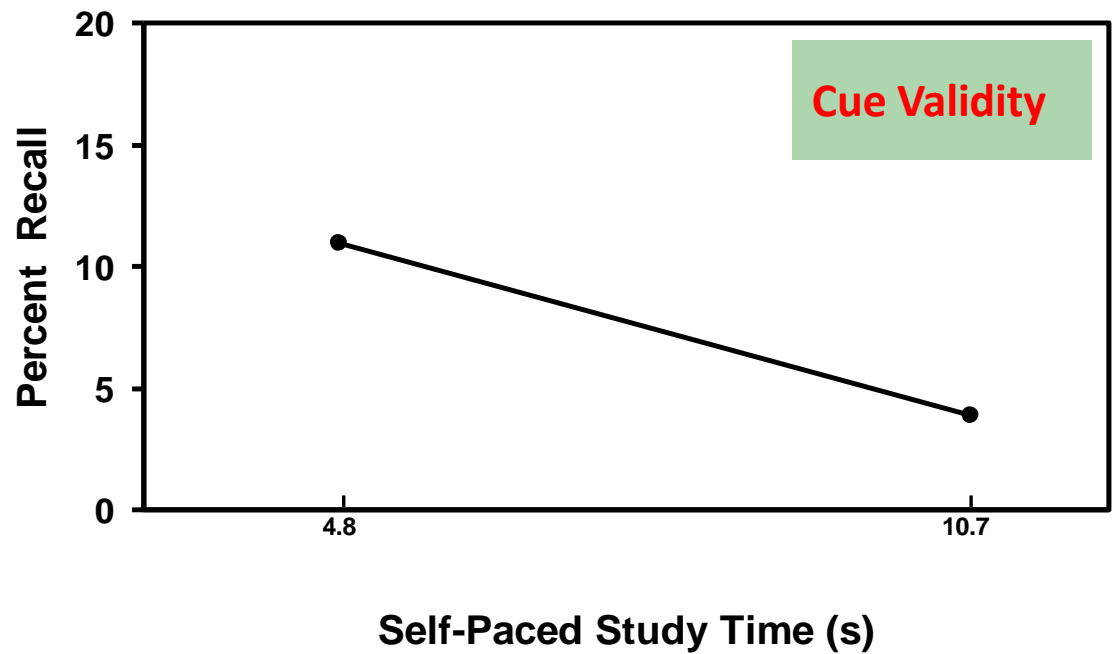

William James (1884)

Common sense says

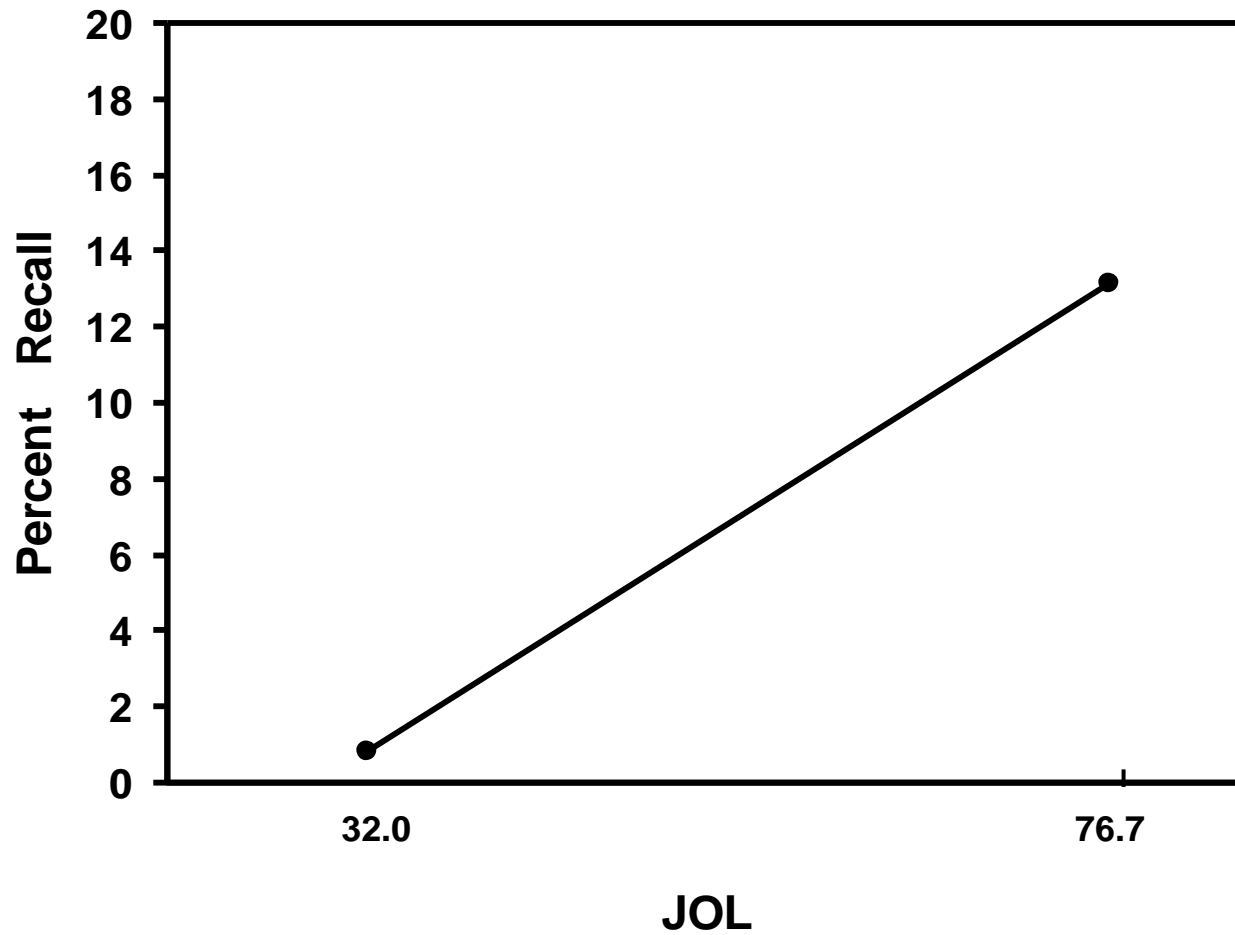

we lose our fortune, are sorry and weep;
we meet a bear, are frightened and run;
we are insulted by a rival, are angry and strike.

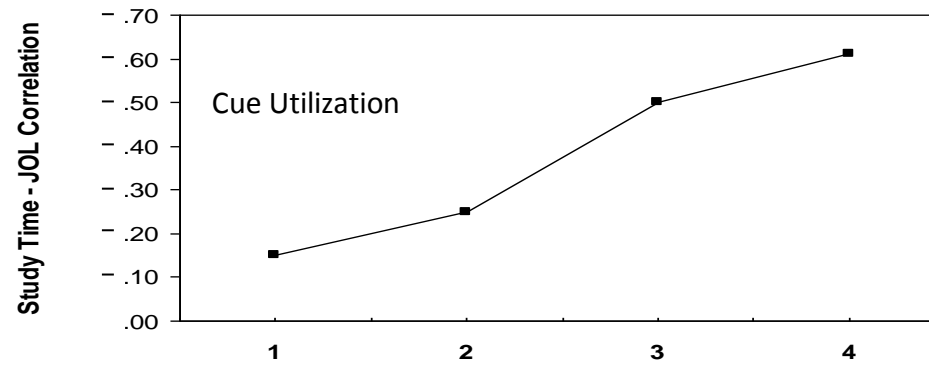

The hypothesis here to be defended

we feel sorry because we cry,
angry because we strike,
afraid because we tremble.

Achievement

The Memorizing Effort Heuristic: Development

(Koriat, Ackerman, Lockl, & Schneider, 2009a)

Regulation

Data Driven

Effort

JOL

Goal Driven

Effort

JOL

The effects of goal-driven regulation

The combined effects of goal-driven and data-driven variations in study time

Attribution

The effects of study time on JOLs differ depending on the source of the variations in study time

This implies an attribution process: Variations in study time are first attributed either to data-driven or goal-driven processes before they affect JOLs

Subjective confidence as a function of decision time

Subjective confidence as a function of decision time

9th graders

(Koriat, Ackerman, Adiv, Lockl, & Schneider, JEPG, 2013)

5th-6th Graders

Training

5th-6th Graders

After

Judgments of learning depend on how learners interpret study time

(Koriat, Nussinson, & Ackerman, in preparation)

זכוכית - נשיקה

Subjective Confidence

For perceptual judgments and general information:

People discriminate between correct and wrong answers

Testing the confidence/accuracy correlation

Normative Accuracy for 2AFC items

Perceptual Comparisons: Length

(Koriat, JEPG, 2011)

Which of the two lines is longer?

1

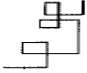

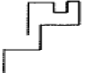

2

Confidence: 0 - 100

Perceptual Comparisons: Length

(Koriat, JEPG 2011)

Experiment 1

Consensually Correct items		
Shorter	Longer	% Correct
		83.59
		77.95
		74.87
Consensually Wrong items		
Shorter	Longer	% Correct
		15.38
		15.90
		24.10

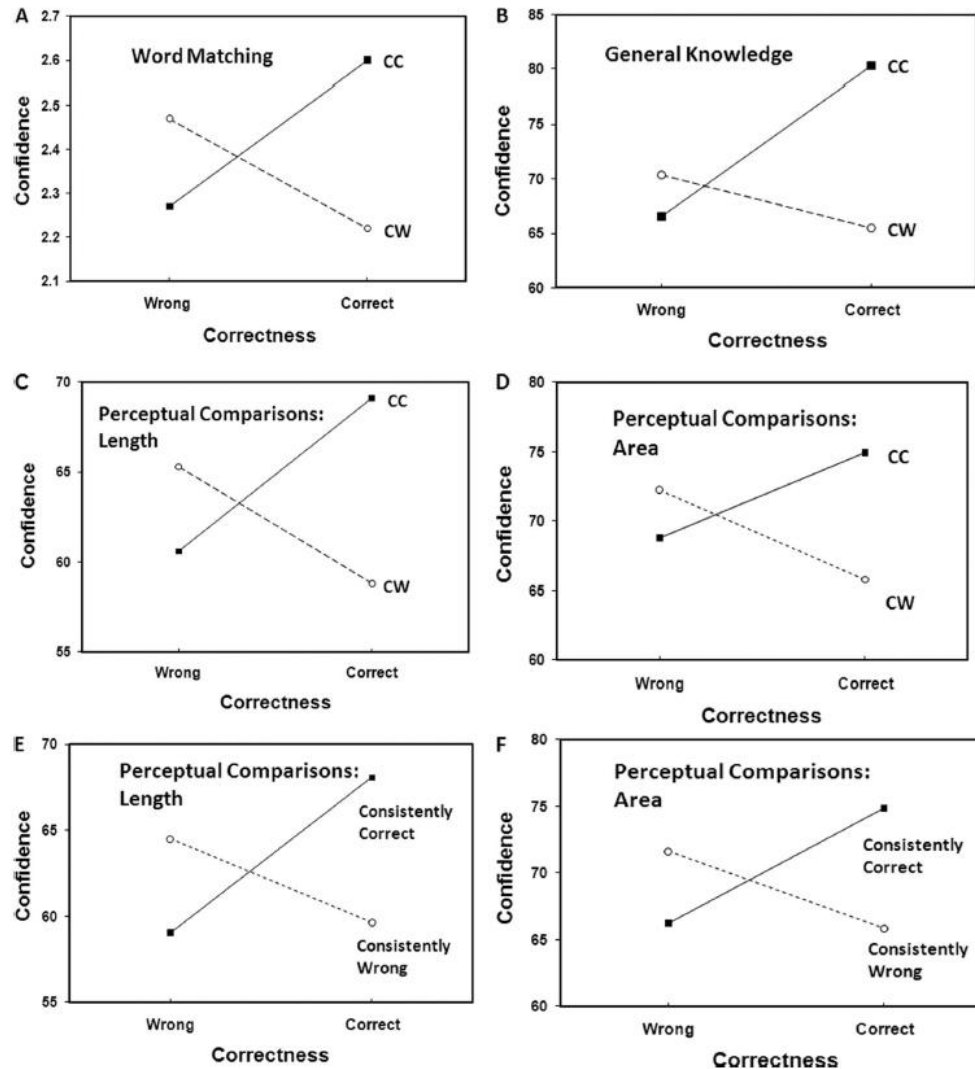

Perceptual Comparisons: Length

(Koriat, JEPG 2011)

Mean confidence for correct and wrong answers, plotted separately for the consensually correct (CC), and for the consensually wrong (CW) items.

The consensuality principle

Implications for Group Decisions

Koriat, A. (2012). When are two heads better than one and why?

***Science*, 336, 360-362.**

John Maynard Keynes (1936): Beauty Contest as a metaphor of equity markets

“It is not a case of choosing those [faces] which, to the best of one’s judgment, are really the prettiest, nor even those which average opinion genuinely thinks the prettiest. We have reached the third degree where we devote our intelligences to anticipating what average opinion expects the average opinion to be. And there are some, I believe, who practice the fourth, fifth and higher degrees.”

Economic predictions

- Mean prediction accuracy: 49.9
- Mean confidence-accuracy correlation:
.08, $t(28) = .97$, $p = .34$.
- Mean confidence-consensuality correlation:
.32, $t(28) = 4.02$, $p < .001$

Monitoring object-level and meta-level

Some metatheoretical Issues

- 1. The genesis of subjective experience**
- 2. The function of subjective experience**
- 3. The cause-and-effect relation between subjective experience and behavior**

Max Wertheimer Minerva Center for Cognitive Processes and Human Performance
